1. Introduction

In this paper, a set of tables is presented surveying existence and nonexistence results for t -designs of small order having no repeated blocks. This introduction is a guide to understanding the tables. Our intent is to be comprehensive, and hence we include every admissible parameter situation on at most thirty elements.

First, we give some basic definitions. A t - (v, k, λ) design, or simply t -design of order v , blocksize k and index λ is a pair (V, \mathcal{B}) . V is a set of v elements, and \mathcal{B} is a collection of k -subsets of V called blocks. Every t -subset appears in precisely λ of the blocks. When \mathcal{B} contains no repeated blocks, the t -design is simple. We are concerned here only with simple t -designs.

One trivial t -design is obtained by taking \mathcal{B} to be all of the k -subsets of V . This is the complete design, and it has index $\lambda = \lambda_{\max} = \binom{v-t}{k-t}$. A second trivial design is the empty design having $\mathcal{B} = \emptyset$ and $\lambda = 0$. Now when $k = v$ or $t = k$, the only simple t -designs are either empty or complete. Hence, nontrivial t -designs have $0 < \lambda < \lambda_{\max}$ and $t < k < v$. We further require that $t \geq 2$.

Given integers t , v , k and λ , the existence of a t - (v, k, λ) design necessitates that the following divisibility conditions hold:

$$\binom{k-i}{t-i} \mid \lambda \binom{v-i}{t-i} \quad \text{for } i = 0, \dots, t-1. \quad (1)$$

A parameter set t - (v, k, λ) is admissible if it satisfies (1).

We can limit the number of parameter sets further by making two simple observations. First, the complement of a t - (v, k, λ) design is a t - $(v, k, \lambda_{\max} - \lambda)$ design; hence

we need only consider cases when $\lambda \leq \lambda_{\max}/2$. Second, complementing each block of \mathcal{B} (with respect to V) from a t - (v, k, λ) design, we obtain a t - $(v, v - k, \lambda \binom{v-t}{t} / \binom{k}{t})$ design and hence we need only consider $k \leq v/2$.

Our tables include every admissible parameter set with $2 \leq t < k \leq v/2$, $v \leq 30$ and $0 < \lambda \leq \lambda_{\max}/2$. In each case that is settled, we report the existence or nonexistence of such a design, along with a reference or explanation.

2. Existence

We introduce first an outline of the techniques used to establish existence. Every t - (v, k, λ) design (V, \mathcal{B}) is also a $(t-1)$ -design with parameters $(t-1)$ - $(v, k, \lambda(v-t+1)/(k-t+1))$. For a fixed element $x \in V$, we can partition \mathcal{B} into two sets, those blocks \mathcal{B}_d containing x and those blocks \mathcal{B}_r not containing x . It is easily verified that $(V \setminus \{x\}, \mathcal{B}_r)$ is a $(t-1)$ - $(v-1, k, \lambda(v-k)/(k-t+1))$ design; this is termed the *residual design* of (V, \mathcal{B}) . Moreover, removing x from each block of \mathcal{B}_d to form \mathcal{B}_d^{\ddagger} yields a $(t-1)$ - $(v-1, k-1, \lambda)$ design $(V \setminus \{x\}, \mathcal{B}_d^{\ddagger})$ called the *derived design* of (V, \mathcal{B}) . The design (V, \mathcal{B}) is the *extension* of $(V \setminus \{x\}, \mathcal{B}_d^{\ddagger})$. Alltop [Alltop75] has shown that a t - $(2k+1, k, \lambda)$ design has an extension to a $(t+1)$ - $(2k+2, k+1, \lambda)$ design if t is even, or if t is odd and $\lambda = \lambda_{\max}/2$. When $(t-1)$ -designs exist with the correct parameters to be the derived and residual designs of a t - (v, k, λ) design, one can combine them to form a simple $(t-1)$ - $(v, k, \lambda(v-t+1)/(k-t+1))$ design (this is not in general a t -design, however). We can apply this observation to known t -designs to produce further t -designs. We call this observation "note (1)" in the tables. Van Trung [vanTrung86] presents a more general formulation which is equivalent.

Van Trung [vanTrung86] also observes that the complement of a t - $(2k+1, k, \lambda)$ design is a t - $(2k+1, k, \lambda(k+1)/(k+1-t))$ design, and hence they can be combined by the observations above to form a t - $(2k+2, k+1, \lambda(2k+2-t)/(k+1-t))$ design. We call this "note (2)" in the tables.

There is a second notion of derived and residual designs. Let (V, \mathcal{B}) be a symmetric 2-design (i.e., $|V| = |\mathcal{B}|$). Fix a block $b^* \in \mathcal{B}$ and define $\mathcal{B}_d = \{b \cap b^* : b \in \mathcal{B} \setminus \{b^*\}\}$ and $\mathcal{B}_r = \{b \setminus b^* : b \in \mathcal{B} \setminus \{b^*\}\}$. Then (b^*, \mathcal{B}_d) and $(V \setminus b^*, \mathcal{B}_r)$ are the *derived* and *residual* designs of (V, \mathcal{B}) , respectively. If (V, \mathcal{B}) is a 2- (v, k, λ) design, the derived design is a 2- $(k, \lambda, \lambda-1)$ design and the residual design is a 2- $(v-k, k-\lambda, \lambda)$ design. The derived design may be trivial (for example, when $\lambda = 1$). Hall [Hall54] showed that if a design exists with parameters 2- $(v-k, k-\lambda, \lambda)$ and $\lambda \in \{1, 2\}$, this design is the residual design of some 2- (v, k, λ) . We call this result "note (4)" in the tables.

Another useful tool in establishing existence is the following lemma of Ganter, Pelikán and Teirlinck [Ganter77].

Permutation Lemma. *If a t - (v, k, λ) design (X, \mathcal{B}) exists, then it can be chosen to be disjoint from \mathcal{D} , a given collection of k -subsets of X , when $v! > |\mathcal{B}| \cdot |\mathcal{D}| \cdot k! \cdot (v-k)!$.*

With the exception of this last lemma, all of the techniques reviewed here apply to specific values of λ . It is readily apparent, however, that while t , v and k are all

severely constrained by our restriction to $v \leq 30$, the range of possible indices remains very large indeed. We are therefore interested in methods which settle all (or most) values of λ in a single construction. We review one such method next.

For given parameters t , v and k , denote by λ_{\min} the smallest positive integer λ satisfying the divisibility conditions. It is easy to verify that if a t - (v, k, λ) design exists, $\lambda_{\min} \mid \lambda$. A (t, k, v) -partition with index vector $(\lambda_1, \dots, \lambda_n)$ is a v -set X together with a partition of all $\binom{v}{k}$ k -subsets on X into classes $\{\mathcal{B}_1, \dots, \mathcal{B}_n\}$ so that (X, \mathcal{B}_i) is a t - (v, k, λ_i) design. If $\lambda_1 = \lambda_2 = \dots = \lambda_n$, the (t, k, v) -partition is *uniform*. If we further require that $\lambda_i = \lambda_{\min}$, the partition is a (t, k, v) -*large set*. Observe that the existence of a (t, k, v) -large set establishes the existence of designs for all admissible parameter sets t - (v, k, λ) (that is, for all admissible λ values for the fixed parameters t , k and v). Since the existence of a (t, k, v) -large set is a particularly elegant method for settling many existence questions, in the Existence column, we report on the existence or (proved) nonexistence of a (t, k, v) -large set by writing LS or NLS respectively.

Often the explanation or reference we give is not the first reference; typically we choose a reference giving the strongest or most general result.

3. Nonexistence

Next we turn to authorities for nonexistence results. The main basic observation is Fisher's inequality: $|\mathcal{B}| \geq |V|$ is necessary for a 2-design (V, \mathcal{B}) to exist [Fisher40]. Ray-Chaudhuri and Wilson [Ray-Chaudhuri75] generalized this to prove that for a t - (v, k, λ) design (V, \mathcal{B}) with even t to exist, we require $|\mathcal{B}| \geq \binom{v}{t/2}$.

Naturally, we can also use the relations discussed earlier to establish nonexistence as well. If a design does not exist, the extension of that design does not exist. Similarly, if the required residual of a design does not exist, the design does not exist. These eliminate a number of parameter sets.

A classic nonexistence result for symmetric 2-designs is also useful. If a symmetric 2- $(v, n + \lambda, \lambda)$ design exists, then n must be a square if v is even; if v is odd, $z^2 = nx^2 + (-1)^{(v-1)/2} \lambda y^2$ must have a solution in integers x , y and z not all zero. See [Chowla50]. We refer to this as "note (3)" in the tables.

Finally, nonexistence for many parameter sets has been established in various references; these are cited in the tables.

4. Supplement

After the tables, we provide a quick summary of known infinite families of simple t -designs for $t \geq 4$. We also provide a table of known *exact* enumerations for simple t -designs. In many further cases, lower bounds on the number of solutions are available; see the tables of Mathon and Rosa [Mathon85] for the case when repeated blocks are permitted.

Disclaimer

While every effort has been made to make these tables accurate and complete, in a tabulation of this size it would be naive to think that no errors have crept in. Please report any omissions or errors to one of the authors.

Furthermore, we do not suggest that simply because a case remains open in the tables, it is by definition interesting. Millions of open cases remain!

Acknowledgements

The tables of Brouwer ([Brouwer77] and [Brouwer86]) proved invaluable in our compilation; the tables in [Southern81] also provided many useful designs. Thanks also to Dom de Caen, Earl Kramer, Spyros Magliveras, Rudi Mathon, Kevin Phelps, Alex Rosa, Luc Teirlinck and Tran van Trung for assistance in locating results. Research of the second author is supported by NSERC Canada Grant A0579; research of the third author is supported by NSF Grant CCR-8711229.

Notes

- (1) Let $(X, B^{(j)})$ be a $t-(v, k^{(j)}, \lambda^{(j)})$ design for $j = 1, \dots, s$ and $2 \leq s \leq t$ such that the following conditions hold:

$$k^{(j)} = k^{(j-1)} + 1, \quad 2 \leq j \leq s. \quad (i)$$

$$\sum_{i=1}^{s-m} \binom{s-m-1}{s-m-i} \lambda^{(i)}_{(t-m)} = \lambda^{(1)}_{(t-s+1)}, \quad 0 \leq m \leq s-2. \quad (ii)$$

Then there exists a $t-(v+s-1, k^{(s)}, \lambda^{(1)}_{(t-s+1)})$ design. See [vanTrung86].

- (2) If there exists a $t-(2k+1, k, \lambda)$ design, then there exists a $t-(2k+2, k+1, \lambda \frac{2k+2-t}{k+1-t})$ design. See [vanTrung86].
- (3) If a symmetric block design exists with parameters v, k, λ , then writing $n = k - \lambda$:
1. If v is even, n is a square.
 2. If v is odd, $z^2 = n^2 + (-1)^{(v-1)/2} \lambda y^2$ has a solution in integers z, y, z not all zero. See [Chowla50].
- (4) Let v, k, λ satisfy $k(k-1) = \lambda(v-1)$ and suppose we are given a block design D with parameters $v' = v - k, k' = k - \lambda, \lambda' = \lambda$, and that $\lambda = 1$ or 2 . Then D can be embedded as a residual design in a symmetric design with parameters v, k, λ . See [Hall54].

Infinite Families of t -designs, $t \geq 4$

- 4- $(2^n + 1, 2^m, (2^m - 3) \prod_{i=2}^{m-1} \frac{2^{n-i} - 1}{2^{m-i} - 1})$ designs exist provided $2 < m < n$. See [Hubaut74].
- 4- $(2^n + 1, 2^{n-1} + 1, (2^{n-1} - 3)(2^{n-2} - 1)(2^{n-1} - 4))$ designs exist provided $n \geq 4$. See [Driessen78].
- 4- $(2^n + 1, 2^m + 1, (2^m + 1) \prod_{i=2}^{m-1} \frac{2^{n-i} - 1}{2^{m-i} - 1})$ designs exist provided $2 < m < n$ and m does not divide n . See [Hubaut74].
- 4- $(2^n + 1 + s, 2^{n-1} - 1, \binom{2^n + s - 3}{s} (2^{n-1} - 1)(2^{n-2} - 1)(2^{n-1} - 4))$ designs exist for each $s \geq 2$ such that $n \geq 6$ is large enough so that $\frac{2^{n-1} - 2}{n - 1} > s + 6$. See [Magliveras87].
- 4- $(2^n + 1 + s, 2^m, \binom{2^n + s - 3}{s} (2^m - 3)\mu)$ designs exist for m sufficiently close to n , with m large enough so that $\binom{v}{k} / \binom{v+s}{s} > \lambda_0(\lambda_0 - \lambda_1)$ where $\mu = \prod_{i=2}^{m-1} \frac{2^{n-i} - 1}{2^{m-i} - 1}$ and λ_0, λ_1 are the number of blocks and replication number respectively. See [Magliveras87].
- 4- $(2^n + 1 + s, 2^m + 1, \binom{2^n + s - 3}{s} (2^m + 1)\mu)$ designs exist for m sufficiently close to n , with m large enough so that $\binom{v}{k} / \binom{v+s}{s} > \lambda_0(\lambda_0 - \lambda_1)$ where $\mu = \prod_{i=2}^{m-1} \frac{2^{n-i} - 1}{2^{m-i} - 1}$ and λ_0, λ_1 are the number of blocks and replication number respectively. See [Magliveras87].
- 5- $(2^n + 2, 2^{n-1} + 1, (2^{n-1} - 3)(2^{n-2} - 1))$ designs exist provided $n \geq 4$. See [Alltop72].
- 5- $(2^n + 3, 2^{n-1} + 1, (2^n - 2)(2^{n-1} - 3)(2^{n-2} - 1))$ designs exist provided $n \geq 5$. See [vanTrung84].
- 5- $(2^n + 4, 2^{n-1} + 2, (2^n - 1)(2^n - 2)(2^{n-2} - 1))$ designs exist provided $n \geq 5$. See [vanTrung86].
- 5- $(2^n + 5, 2^{n-1} + 2, 2^n(2^n - 1)(2^n - 2)(2^{n-2} - 1))$ designs exist provided $n \geq 6$. See [vanTrung86].
- 5- $(2^n + 6, 2^{n-1} + 3, 2^{n-1}(2^n + 1)(2^n - 1)(2^n - 2))$ designs exist provided $n \geq 6$. See [vanTrung86].
- 5- $(2^n + 2 + s, 2^n + 1, \binom{2^n + s - 3}{s} (2^{n-1} - 3)(2^{n-2} - 1))$ designs exist for each $n \geq N$ such that $s > 0$, $N \geq 4$ and $\frac{2^N - N}{N - 1} > s + 4$. See [Magliveras87].
- t - $(v, t + 1, (t + 1)^{\binom{2t+1}{t}})$ designs exist provided $v \equiv t \pmod{(t + 1)^{\binom{2t+1}{t}}}$ and $v \geq t + 1$. See [Teirlinck87].

Results on the Explicit Enumeration of t -Designs

The following table contains t -designs without repeated blocks for which explicit enumeration had been done. $N(\lambda; t, k, v)$ denotes the number of pairwise non-isomorphic t - (v, k, λ) designs.
